Featured projects

Eventum

Eventum is an application designed to optimize and automate the process of creating, managing and confirming events in Marina de Empresas. Its main objective is to improve operational efficiency and offer a more convenient experience to participants wishing to attend our events.

Back End

Front End

About me

As a Full Stack developer, I have acquired solid skills both in the Front-End, where I work with React and Angular, and in the Back-End, where I have accumulated experience using Node.js and Express.

Although I started my professional career in a different industry, such as Industrial Robotics, this allowed me to get to know the world of programming and my passion for web development, which has led me to make a professional transition. My dedication to continuous improvement motivates me to constantly expand my knowledge and contribute in a valuable way to the field of web development.

I consider myself a decisive person, which in my career has manifested itself when facing challenges such as the automation of industrial processes or digitization to eliminate paper from work processes.

Education
